Becoming an Expert in Photoshop Painting and graphic designers often need the skills of a photo retoucher, and that's where Photoshop really shines. Once you learn the basics of photo retouching, you'll never need to touch a camera again! In the following sections, we'll give you a crash course in Photoshop, helping you get started, keep you current, and eventually allow you to become the best photo retoucher in your field. In Part I, we give you a beginner's primer in Photoshop basics that will allow you to take advantage of Photoshop's feature sets. We lay the groundwork for further study by showing you what tools to use and where to use them in the various Photoshop windows. We also take you through major steps in Photoshop's raster editing system. In Part II, we focus on many of the most useful tools for photographers, and show you how to use them to fix everything from minor problems to large flaws. We explain the magic that's behind that one drop shadow, and show you how to replace it with a custom one made of your own choice of color, width, and opacity. Part I: Working with Photoshop After you have selected your destination folder containing your images, you'll need to open Photoshop. The first time that you open Photoshop, you'll have to configure your default settings to match your hardware. You can do so in Photoshop preferences under Settings ➤ System. Open the Preferences dialog box by clicking the Photoshop icon in the upper-left corner of the Photoshop window or pressing Ctrl+K. When the Preferences dialog box opens, navigate to the General section (see Figure 1) and locate the option that is named as Adobe Photoshop. This is the section where you can change your settings to match your system. The following settings are the most important settings to change: • System Colors: To change your system colors, simply choose Appearance from the System menu and click the System Colors tab. After selecting the Color Scheme tab, you'll be able to change the colors. The default colors are OK for most image editing, but you may want to change the colors to match the colors on your monitor. You also may want to change the colors to match the standard colors used by other programs. The next time you open Photoshop, your custom colors will be used. • Enhance: To change your screen magnification settings, simply click the Enhance tab and select your preference from the

The free version of Photoshop Elements offers a lot of functionality for photographers and artists, including editing pictures on the go and creating a fun, unique look for images with background colours. You can modify the colors and contrast of your photos using what are called filters. This article introduces you to the graphic tools in Photoshop Elements. Adjusting your photo's image One of the most important things in photography is the image's exposure. The amount of light that falls on your camera can have a big impact on the way your photos look. To make sure your image is exposed properly, you'll need to use an exposure tool, or use a feature in Photoshop Elements. Use a photo editor to make sure your image is well exposed In any photo editor, including Photoshop Elements, you can use the image histogram to check if the exposure of your image is accurate. In the picture below, the picture looks overexposed, and the most light is above the middle of the picture. In order to fix it, you can use the Exposure slider to reduce the image's exposure. To access the image histogram, you can use the Toolbox. Click on the panel at the top, go to the Histogram and press the Selection arrow. The histogram is a graph showing how much light is in your image. A histogram with an evenly divided bar is an ideal one. If there are too many parts that are over exposed, this means you have to use an Exposure slider to reduce the light. You can also use the Exposure slider to increase the amount of light in the image. Click on the Adjustments button, go to Exposure, and adjust the Amount slider. As you reduce the amount, darker colours appear at the bottom of the graph, and the bright colours become more darker. Adjusting the brightness of your image If you look at the screen, you'll notice that your picture is a bit dark. You'll also notice that the lightest part is the lightest and darkest parts are the darkest, which makes the picture look weird. This is because you've edited the image and want it to look better. This effect is called over

exposure, and the first thing you should do is to fix this. To start, press the Ctrl + T button to

not remain the same and therefore I was unable to get the most out of the user license. Thirdly, for the work/play balance, what do you think the balance should be between the two? Is there a solution? In the past I have found that being someone who is really driven by work, in my case, then achieving an idea and using all of the available tools to fulfil it, works well for me. It's unfortunate that this isn't a more common approach, therefore, the balance will never be perfect, but nevertheless, there's enough tension for the health of the users. So perhaps if I had to choose and I thought I could only have one or the other, I would go for play. Why? Because I am lazy and always want to play. It's my preferred way of escaping reality and doing something that feels good, that makes me smile. I know it's not practical and many people would love to put down the idea of playing, but if I had to choose, for me, it would be play and a balance is the price I pay. Primary care physicians are likely to play a pivotal role in linking newly diagnosed patients to the appropriate HIV/AIDS-related services. A study conducted in Wisconsin found that primary care physicians were often the first to recognize signs and symptoms of HIV/AIDS in their patients, and thus were in a key position to provide early identification of HIV-positive patients [@pone.0052890-Younge1]. This study used a unique resource in China, the NHIF database, which contains data on all health care services in China. Therefore, it is possible to assess the utilization of HIV/AIDS-related primary care services. The results showed that from 2004 to 2008, there was an increase in both the annual number and the percentage of HIV/AIDS patients receiving primary care among all persons in China. The estimated annual number of people visiting HIV/AIDS-related primary care physicians in 2007 was 2.1 million, of whom 27% were women. About 20% of these visits were with an opportunistic infection. It is noteworthy that more than half of HIV/AIDS
